EXPERIENCE

Software Engineer

September 2024 – Present

Zero Impact Energy

Costa Mesa, CA

- Developed the EVOLV Platform, supporting 1,000+ concurrent WebSocket connections across 300+ live sites, enabling real time monitoring and control of EV chargers with site specific configurations for users and organization administrators, developed with a C# .NET Core backend.
- Built station down time logging and fault detection systems for EV charging stations by parsing JSON-based OCPP messages, with exception handling to ensure reliability and automated email alerts for disconnected chargers.
- Improved code quality by increasing test coverage and reducing cyclomatic complexity by 40% across the main repository secured all API and GraphQL endpoints against vulnerabilities with authentication requirements and optimized LINQ queries to reduce latency and improve performance.
- Built smart energy management features, including grid demand response integration and dynamic time-of-use pricing logic that allowed EV charging networks to adapt to utility peak/off-peak energy rates and reduce operational charging costs.

Computer Science Tutor

Aug 2023 – May 2024

Tutors and Friends

La Jolla, CA

- Tutored students from middle school through college in multiple subjects, with an emphasis on computer science and programming fundamentals.
- For aspiring computer science students in high school developed a curriculum ranging from basic topics such as data types to data structures and algorithms delving into topics such as graph theory and greedy algorithms.
- Guided students through hands-on coding exercises and algorithmic problem solving in Python and C#, reinforcing core concepts such as recursion, object-oriented programming, and time complexity analysis.
- Helped students transition from theoretical coursework to practical application by guiding them through real coding scenarios and implementation-focused exercises.

Software Engineer Intern

June – September 2022

First American

Santa Ana, CA

- Developed a script that optimized the costs of AWS DynamoDB tables used by over 100 people in a developer environment. It used a YAML script that triggered every week in the Azure Pipeline. This script saved costs for DynamoDB tables by 78%
- Implemented automated pipeline scripts to audit and report recently updated AWS Lambda functions within defined time windows, improving deployment visibility and operational tracking.
- Worked with Git-based workflows in Azure Repos, following branching strategies and contributing to code reviews integrated into pipeline execution.

PROJECTS

TerraNomics (Geospatial Site Selection Engine) | *Python, FastAPI, PostGIS, React, TypeScript, ArcGIS SDK, Kubernetes*

- Architected an LLM pipeline converting natural language prompts into structured, user-editable analysis plans via OpenAI tool-calling against a closed metric enum, ensuring the model never accesses raw spatial data.
- Built an async geospatial scoring engine with PostGIS hex-grid candidate generation, Census demographic apportionment, and drive-time isochrones streamed to a React frontend via Redis and SSE.

Rec League AI Analyzer (Fantasy football Trade Evaluation Platform) | *JavaScript, Node.js, Express, OpenAI API*

- Integrated with Yahoo, ESPN, and Sleeper APIs to import league and roster data for automated player and team analysis.
- Developed an AI-powered Trade Analyzer using the OpenAI API to evaluate proposed trades and generate fairness scores with player and team summaries.

EDUCATION

University of California, San Diego

La Jolla, CA

Bachelor of Science in Computer Engineering

2020 – 2024

TECHNICAL SKILLS

Languages: C#, .NET, Python, JavaScript, React, HTML, CSS, SQL

Developer Tools: Visual Studio 2022, VS Code, Git, Github, Azure, Cursor, Postman

Certifications: AWS Certified Cloud Practitioner
